# SAMME

(Stagewise Additive Multimodeling using Multiclass Exponential Loss Functions)

⇒ Adaptive boosting

↓  
Adaboost

⇒ Decision stumps  
level of tree = 1

Forest of stumps

A tree with a single root node of  
2 leaf nodes

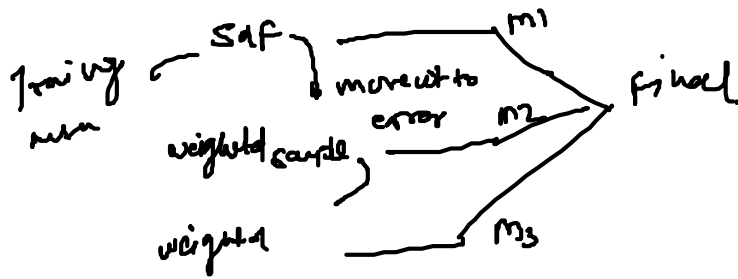

⇒ Weak learner / base learner

## # Bagging

## # Boosting

## # Dataset

St. no.	Age	Gender	BP	Target	wt	Age up	update	normalized wt
1	63	1	128	1	0.14	1	0.08	0.094
2	37	1	100	0	0.14	0	0.08	0.09
3	41	0	88	0	0.14	1	0.22	0.16
4	72	1	128	1	0.14	1	0.08	0.09

Normalized weights are used to update the model.

3	41	0	85	0	0.14	1	0.08	0.09	misclassified
4	56	1	125	1	0.14	1	0.08	0.09	
5	57	0	130	0	0.14	0	0.08	0.09	
6	85	1	80	1	0.14	0	0.22	0.09	
7	52	0	95	1	0.14	1	0.08	0.09	
					<u>0.14</u>		<u>0.86</u>	<u>1</u>	

1)  $\text{weight} = \frac{1}{n} = \frac{1}{7} = 0.14$

2) select 1 feature, lowest Gini / highest 24.

Total error =  $\frac{2}{7} = \underline{\underline{0.28}}$

3) performance of stump:

$$\begin{aligned} \alpha &= \frac{1}{2} \times \log_e \left( \frac{1 - \text{TE}}{\text{TE}} \right) \\ &= \frac{1}{2} \times \log_e \left( \frac{1 - 0.28}{0.28} \right) \\ &= \frac{1}{2} \times \log_e (2.57) \\ &= \frac{1}{2} \times 0.94 \\ \alpha &= \underline{\underline{0.47}} \end{aligned}$$

4) new weights

Misclassified = +  
correctly classified = -

new weight = old weight  $\times e^{\pm \alpha}$

new weight (+) =  $0.14 \times e^{+0.47}$   
 $= 0.14 \times 1.6$   
 $= \underline{\underline{0.22}}$

new weight (-) =  $0.14 \times e^{-0.47}$   
 $= 0.14 \times 0.62$   
 $= 0.08$

# normalize the wts

$$(-) \quad \frac{0.08}{0.84} = 0.094$$

$$(+) \quad \frac{0.12}{0.84} = 0.16$$
